

5.1.1 ARCHITECTURE DESCRIPTION

This scheme focuses on improving how we control access, revoke user permissions, and protect data integrity. It uses the advantages of the FAME (Fully secure Attribute-based Message Encryption) framework to create a more effective solution for managing user permissions and securing stored data. An important aspect of this system is its emphasis on efficiency. By incorporating the FAME framework, the scheme improves both the encryption and decryption processes, making the system more responsive and reducing the computational workload. Additionally, the system introduces a way to detect incorrect revocations by users, adding an extra layer of security and accountability to the cloud storage system.
